Cosmetic Tattoo Care Instruction

1. You may use cold compress/ice pack protected with a cloth as necessary to reduce swelling the first day.
2. First 48 hours do not wash or use soap around the tattoo area. You may use warm towel to wipe the tattoo area.
3. Apply light smear vaseline/ointment on the tattoo area 2-3 times a day for the next 4 days.
4. Some itching is normal. DO NOT pick, peel, scratch around the tattoo area, let it fall off itself. If not your color may heal unevenly and you risk scarring and infection.
5. If your feeling itchy, apply more vaseline around the tattoo area.
6. Let your cosmetic tattoo heal on its own naturally.
7. Do not expose your healing skin to direct sun, tanning beds, hot tubs, sauna, salt water, chlorinated pools or extremely hot water for 1 week.

Permanent makeup will appear extremely intense and thick immediately after the procedure. The color will look dark for the first few days. Don't Worry! It changes. Excess pigment sheds off over the next 2-3 days, and then the skin starts healing over. A layer of healed skin on top of the pigment masks and tones it down considerably. As the swelling goes down the lines will be thinner. Color will continue to soften over the next few weeks. It will look very natural in 1-2 months.
